Deep Neural Networks

[Krizhevsky et al. 2012, "ImageNet Classification with Deep Convolutional Neural Networks"]

Deep Neural Networks

The image shows a user interface for a deep learning model. At the top, there are four categories: "mite", "container ship", "motor scooter", and "leopard". Below each category is a small image and a list of predicted labels with their confidence scores.

- mite:** mite (0.99), black widow (0.01), cockroach (0.01), tick (0.01), starfish (0.01)
- container ship:** container ship (0.99), lifeboat (0.01), amphibian (0.01), fireboat (0.01), drilling platform (0.01)
- motor scooter:** motor scooter (0.99), go-kart (0.01), moped (0.01), bumper car (0.01), golfcart (0.01)
- leopard:** leopard (0.99), jaguar (0.01), cheetah (0.01), snow leopard (0.01), Egyptian cat (0.01)

Below the categories, there are two more images: a red classic car and two mushrooms. A text input field contains the message "Deep learning is awesome!" with a translation below it: "L'apprentissage en profondeur est génial!".

Natural Language Processing

■ Translation

The screenshot shows a translation interface with two main sections. The left section is for input, and the right section is for output. Both sections have language selection menus at the top.

Input Section:

- Label: DÉTECTOR LA LANGUE
- Selected Language: ANGLAIS
- Text Input: Deep learning is awesome!
- Close button: ×
- Bottom controls: A microphone icon, a speaker icon, and a progress bar indicating 25 / 5000.

Output Section:

- Label: FRANÇAIS
- Selected Language: FRANÇAIS
- Text Output: L'apprentissage en profondeur est génial! ☆
- Bottom controls: A microphone icon, a speaker icon, and a set of icons for copy, edit, and share.

Gradient Descent For Deep Neural Networks

Réalité : trouver le fond de la vallée
embrumée, à tâtons

Adapted by Philippe Giguère for Université Laval GLO-7030 from Standford CS231N

Computation of Gradient

Using "**backpropagation**", we compute the **partial derivative** of each parameter **with respect to the loss**. The vector containing all partial derivatives is called the **gradient**.

$$d = \nabla_{\theta} J(\theta) = \left[\frac{\partial J(\theta)}{\partial \theta_1}, \dots, \frac{\partial J(\theta)}{\partial \theta_n} \right]$$

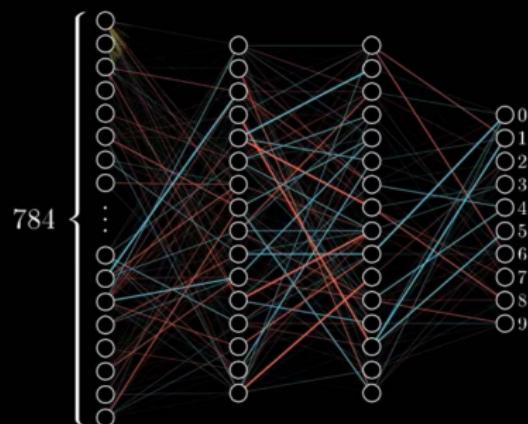

To update the parameters:

$$\theta \leftarrow \theta - \epsilon d$$

ϵ is called the learning rate.

Gradient

Training in
progress. . .

Extrait de <https://youtu.be/IHZwWFHwa-w> 3Blue1Brown

Optimization Algorithms

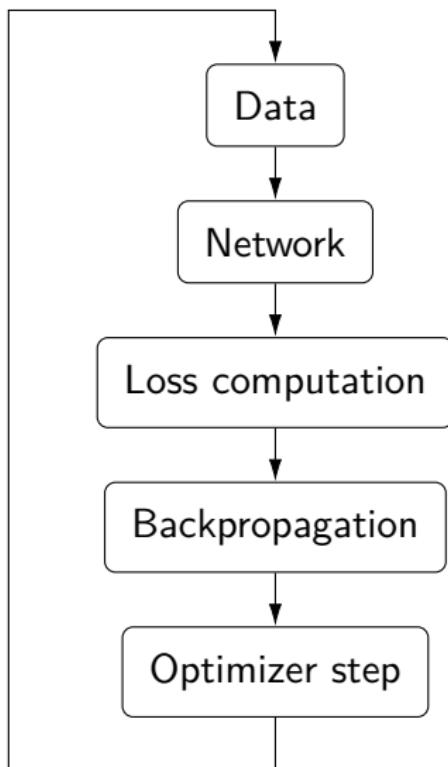

Simplest update rule:

$$\theta \leftarrow \theta - \epsilon d$$

Many types exist:

- **SGD**
- SGD with momentum
- SGD with momentum Nesterov
- Adagrad
- RMSprop
- **Adam**

Training Procedure

Training Procedure

procedure TRAIN($f(\cdot; \theta)$, S)

input: Neural network f parameterized by θ

input: Dataset $S = \{(x_1, y_1), \dots, (x_N, y_N)\}$

end procedure

Training Procedure

```
procedure TRAIN( $f(\cdot; \theta)$ ,  $S$ )
    input: Neural network  $f$  parameterized by  $\theta$ 
    input: Dataset  $S = \{(x_1, y_1), \dots, (x_N, y_N)\}$ 
    for  $n$  epochs do
        end for
end procedure
```

Training Procedure

```
procedure TRAIN( $f(\cdot; \theta)$ ,  $S$ )
    input: Neural network  $f$  parameterized by  $\theta$ 
    input: Dataset  $S = \{(x_1, y_1), \dots, (x_N, y_N)\}$ 
    for  $n$  epochs do
        Let  $S' = S$ 
        while  $S' \neq \emptyset$  do
            Draw a batch  $B \subseteq S'$  of  $b$  examples.
            ...
        end while
    end for
end procedure
```

Training Procedure

procedure TRAIN($f(\cdot; \theta)$, S)

input: Neural network f parameterized by θ

input: Dataset $S = \{(x_1, y_1), \dots, (x_N, y_N)\}$

for n epochs **do**

 Let $S' = S$

while $S' \neq \emptyset$ **do**

 Draw a batch $B \subseteq S'$ of b examples.

$$\ell = \frac{1}{b} \sum_{(x,y) \in B} \mathcal{L}(f(x; \theta), y)$$

end while

end for

end procedure

An example of overfitting, underfitting and a model that's "just right!"

Neural Networks are Powerful

- Universal Approximation Theorem
- ... is a *blessing*!
- ... and a *curse*!
- How can we avoid overfitting?

Regularization

Add a penalty term to the loss¹:

$$\mathcal{L}(f(x), y) = \mathcal{L}_{\text{MLE}}(f(x), y) + \lambda \Omega(f)$$

¹MLE stands for Maximum Likelihood Estimation.

Regularization

Add a penalty term to the loss¹:

$$\mathcal{L}(f(x), y) = \mathcal{L}_{\text{MLE}}(f(x), y) + \lambda \Omega(f)$$

- L2 regularization: $\Omega(f) = \|\theta\|_2^2$, where θ are the learnable parameters of the neural network f .

¹MLE stands for Maximum Likelihood Estimation.

Regularization

Add a penalty term to the loss¹:

$$\mathcal{L}(f(x), y) = \mathcal{L}_{\text{MLE}}(f(x), y) + \lambda \Omega(f)$$

- L2 regularization: $\Omega(f) = \|\theta\|_2^2$, where θ are the learnable parameters of the neural network f .
- L1 regularization (or LASSO): $\Omega(f) = \|\theta\|_1$

¹MLE stands for Maximum Likelihood Estimation.

Regularization

Add a penalty term to the loss¹:

$$\mathcal{L}(f(x), y) = \mathcal{L}_{\text{MLE}}(f(x), y) + \lambda \Omega(f)$$

- L2 regularization: $\Omega(f) = \|\theta\|_2^2$, where θ are the learnable parameters of the neural network f .
- L1 regularization (or LASSO): $\Omega(f) = \|\theta\|_1$
- etc.

¹MLE stands for Maximum Likelihood Estimation.

Dropout

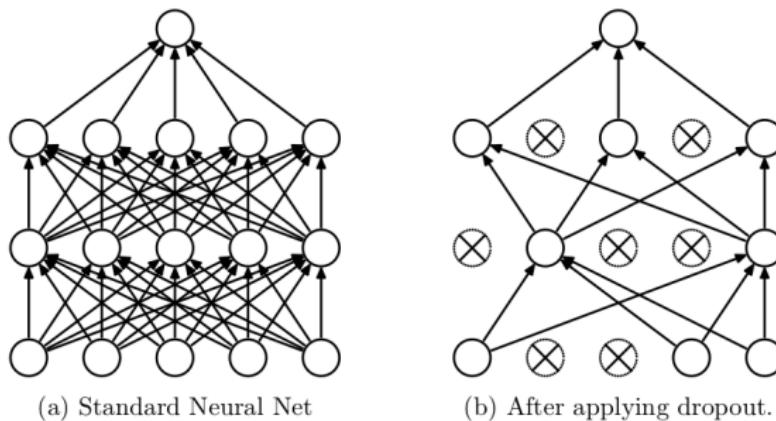

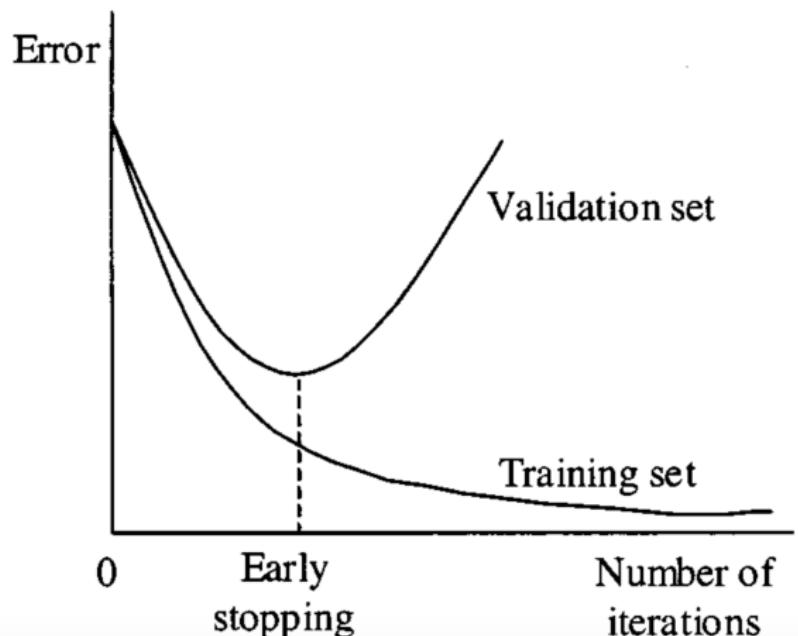

Figure 1: Dropout Neural Net Model. **Left:** A standard neural net with 2 hidden layers. **Right:** An example of a thinned net produced by applying dropout to the network on the left. Crossed units have been dropped.

Early Stopping

Extract a validation set \mathcal{V} from the training set. Use it to assess generalization potential.

More ways to regularize

- Control the model capacity (e.g.:depth)
- More Data
- Data Augmentation

- $\tanh(z)$

- The ReLU function:

- The logistic function (also called sigmoid function):

- The softmax function:

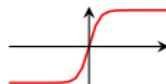

$$\text{softmax}(z)_i = \frac{\exp(z_i)}{\sum_{j=1}^m \exp(z_j)}$$

for $z = Wx + b \in \mathbb{R}^m$.

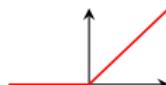

Activation Functions

Given a non-activated output $z = w^\top x + b$, then $\sigma(z) = \dots$

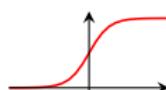

- $\tanh(z)$

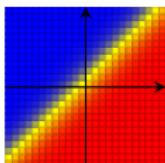

- The ReLU function:

- The logistic function (also called sigmoid function):

- The softmax function:

$$\text{softmax}(z)_1 = \frac{\exp(x)}{\exp(x)+\exp(y)} \text{ for } z = [x, y]$$

Loss Function

Measure of error between a prediction $\hat{y} = f(x)$ and a ground truth y .

Goal: minimize the loss function!

- Squared error (SE) for regression:

$$\mathcal{L}_{\text{SE}}(\hat{y}, y) = (\hat{y} - y)^2$$

for $\hat{y}, y \in \mathbb{R}$.

Loss Function

Measure of error between a prediction $\hat{y} = f(x)$ and a ground truth y .

Goal: minimize the loss function!

- Cross-entropy loss for classification with C classes ($\mathcal{Y} = \{1, \dots, C\}$)

Loss Function

Measure of error between a prediction $\hat{y} = f(x)$ and a ground truth y .

Goal: minimize the loss function!

- Cross-entropy loss for classification with C classes ($\mathcal{Y} = \{1, \dots, C\}$)
 - $y \in \mathcal{Y}$
 - $\hat{y} = [\hat{y}_1, \dots, \hat{y}_C] = \text{softmax}([z_1, \dots, z_C])$

Loss Function

Measure of error between a prediction $\hat{y} = f(x)$ and a ground truth y .

Goal: minimize the loss function!

- Cross-entropy loss for classification with C classes ($\mathcal{Y} = \{1, \dots, C\}$)
 - $y \in \mathcal{Y}$
 - $\hat{y} = [\hat{y}_1, \dots, \hat{y}_C] = \text{softmax}([z_1, \dots, z_C])$

Based on the cross entropy:

$$H(q, p) = - \sum_{c \in \mathcal{Y}} p(c) \log q(c)$$

Loss Function

Measure of error between a prediction $\hat{y} = f(x)$ and a ground truth y .

Goal: minimize the loss function!

- Cross-entropy loss for classification with C classes ($\mathcal{Y} = \{1, \dots, C\}$)
 - $y \in \mathcal{Y}$
 - $\hat{y} = [\hat{y}_1, \dots, \hat{y}_C] = \text{softmax}([z_1, \dots, z_C])$

Based on the cross entropy:

$$H(q, p) = - \sum_{c \in \mathcal{Y}} p(c) \log q(c)$$

where $p(c) = \mathbb{1}(y = c)$ and $q(c) = \hat{y}_c$.

Loss Function

Measure of error between a prediction $\hat{y} = f(x)$ and a ground truth y .

Goal: minimize the loss function!

- Cross-entropy loss for classification with C classes ($\mathcal{Y} = \{1, \dots, C\}$)
 - $y \in \mathcal{Y}$
 - $\hat{y} = [\hat{y}_1, \dots, \hat{y}_C] = \text{softmax}([z_1, \dots, z_C])$

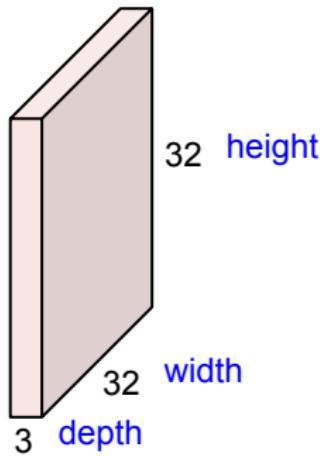

Based on the cross entropy:

$$H(q, p) = - \sum_{c \in \mathcal{Y}} p(c) \log q(c)$$

where $p(c) = \mathbb{1}(y = c)$ and $q(c) = \hat{y}_c$. This simplifies to:

$$\mathcal{L}_{\text{CE}}(\hat{y}, y) = - \sum_{c=1}^C \mathbb{1}(y = c) \log \hat{y}_c = - \log \hat{y}_y$$
